US-60-185-359-1293 Application US/60185359

Sequence 1293, Application US/60185359

GENERAL INFORMATION:

APPLICANT: Venter, J. Craig

TITLE OF INVENTION: The Drosophila Genome, Primary Nucleic

TITLE OF INVENTION: Acid Sequences, Systems Containing The Nucleic Acid

TITLE OF INVENTION: Sequences and Uses Thereof

FILE REFERENCE: CL000284

CURRENT APPLICATION NUMBER: US/60/185,359

CURRENT FILING DATE: 2000-02-28

NUMBER OF SEQ ID NOS: 2926

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 1293

LENGTH: 263456
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

Pr A plant ferritin gene induced in acidic growth conditions

Pr plants, improves resistance to acidic growth conditions

Pr plants, improves resistance to acidic growth conditions

PS Claim 1; Page 6-7; 9pp; Japanese.

CC Gris sequence represents a plant ferritin gene. The plant ferritin

CC gene, whose production is induced in acidic soil, is involved in the

CC coccurrence of disorders in a plant caused by acidic conditions.

CC This gene can be used for breeding of plants highly resistant to acidic

CC soil. The cDNA or its fragment can also be used for diagnosis of a

CC glant planted in acidic soil by determining the expression of ferritin

CC in it. Ferritin can be expressed excessively by introducing the cDNA

CC of the invention into a plant in the sense direction to reinforce the

CC resistance of the plant to acidic soil. Therefore acidic soil which could

CC not the utilised for agricultural purposes can be utilised by the

Claim 2; Pages 26-33; 45pp; English.

This represents a cDNA from BAC bk206c7 encoding a partial sequence of a human calcium channel subunit alpha-1. The invention provides isolated CNA fragments coding for novel calcium channel subunits alpha-II and alpha-IH. An eukaryotic cell transiently or stably transformed with an expression vector containing the calcium subunits encoding DNA fragments can be used for expressing the calcium channel. The cells are optionally further transformed to express alpha 2 delta or beta calcium channel or beta the proteins. The transformed cells are useful for identifying compounds capable of acting as agonists or antagonists for the alpha-II calcium channel. The nucleic acid sequences can be used in histological assay to determine the tissue distribution of the novel calcium channel
                                                                                                                                                                                                                                                                                                                                                                          Query Match

Q95:10 encodes R78318 human thyroid hormone receptor alpha-1 (hr. alpha-1). The nucleic acid can be used to develop prods. for use analysis assays and therapeutic agents. hTR-alpha-1 can be used tests for thyroid function, or for producing antibodies for use affinity purificn., detection and quantification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated human genes and the secreted polypeptides they encode - provided for diagnosis and treatment of e.g. cancers, neurological providers, immune diseases, inflammation or blood disorders

PS Claim 1; Page 215; 385p; English.

CThis sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to human immunoglobulin Fc portion (e.g. x00602) for increasing the stability of the fused protein as compared to the human protein only.

CC compared to the human protein only.

CC The invention relates to 87 novel genes and their fragments (nucleic acid sequences: x00611-x00724; amino acid sequences w67807-w68004) which care useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in (see x00611 for described contents).
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                     Human long chain DNA and antibodies which bind to the peptide(s) - is potentially useful in treating nervous disorders Claim 4; Page 92-93; 109pp; Japanese.

The present sequence represents human derived long chain DNA comprising at least a peptide-encoding region. Peptides encoded by the human derived long chain DNA, may be used for detecting substances which bind to the peptides, and for detecting substances which suppress or inhibit binding to these peptides. The peptides and their inhibitors are potentially useful in treating nervous disorders.

The present sequence represents human derived long chain DNA comprising at least a peptide-encoding region. Peptides encoded by the human derived long chain DNA, may be used for detecting substances which bind to the peptides, and for detecting substances which suppress or inhibit binding to these peptides. The peptides and their inhibitors are potentially useful in treating nervous disorders.

Sequence 1269 BP; 263 A; 413 C; 285 G; 308 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                          22-APR-1998 (first entry)

                                                                      Problement the control of the process of the sequence is that encoding the human bone morphogenetic protein CC BMP-8. It may be used in the product of a recombinant heterodimeric CC protein having bone stimulating activity. This heterodimer is CC encoded by a sequence encoding BMP-2 or BMP-4 or a fragment and a CC sequence encoding a second protein or fragment, BMP-8. It may be CC used in compsns. for wound healing, tissue repair, and in similar CC compsns. which have been indicated for the use of individual BMPs. CC Increased potency of the heterodimer over individual BMPs may permit CC induces cartilage and/or bone growth in circumstances where bone CC induces cartilage and/or bone growth in circumstances where bone CC fractures and cartilage defects in humans and other animals. The CC contributes to the repair of congenital, trauma induced or oncologic resection induced craniofacial defects, and also is useful in cosmetic suspens and in other tooth repair processes. It may also be useful in the treatment of periodontal contributes and ulcers) and related tissue repair, and may increase neuronal survival and be useful in the transplantation and treatment of conditions exhibiting a decrease in neuronal survival. It may be useful in the transplantation and treatment of combined with other agents beneficial to the bone and/or cartilage defect, wound or tissue in question, e.g. EGF, PDGEF, TGF-alpha, Sequence 1002 BP; 196 A; 330 C; 285 G; 191 T;

Mature hOP2 is one of the preferred known morphogens which can be used in the manufacture of pharmaceuticals for inducing non-chondrogenic mammalian tissue growth, progenitor cell proliferation and hepatic tissue growth and for maintaining the phenotypic expression of differentiated cells in a mammal. Morphogenic compositions of the invention can also be used to treat blood disorders and impaired or lost immune function. Morphogens sharing at least 70% homology with hOP2 are included.

The methods can be used for protecting individuals at risk for loss of bone mass such as postmenopausal females, aged individuals and individuals undergoing dialysis. The loss of bone mass may result from an imbalance in bone resorption or bone formation, an imbalance of calcium or phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that encoding human osteogenic protein 2 (hop-2) a morphogenically active protein which may be used as part of a method for treating a bone fracture or a disease which causes or results in bone fractures or other defects in skeletal microstructure. Such diseases include chronic renal failure and

PT of a morphogen - by assaying test tissue type cells for parameter indicative of a prodn. level change of morphogen

PT indicative of a prodn. level change of morphogen

PS Disclosure; Page 95-97; 132pp; English.

CC This sequence encodes the human morphogen hOP2, isolated from the CC hippocampus. This morphogen is inactive when reduced but is active CC as an oxidised homodimer and when oxidised in combination with other CC morphogens. These morphogens are capable of stimulating proliferation CC of progenitor cell, stimulating the differentiation of progenitor cells, stimulating the proliferation of differentiated cells and CC supporting the growth and maintenance of differentiated cells, including the redifferentiation of transformed cells. These morphogens may also be capable of inducing redifferentiation of CC committed cells under appropriate environmental conditions.

Claim 26; Page 119-121; 165pp; English.
Human osteogenic protein (OP)-2 is a preferred morphogen for use in treating tissue damage in e.g. inflammatory disease, autoimmune disease, arthritis, psoriasis, dermatitis, diabetes and emphysema.

Proteins having at least 70% homology with OP-2 amino acid sequences can also be used. See R33400 for mature hOP-2.

New pure mammalian osteogenic proteins - induce cartilage and endochondral bone formation when in association with a matrix Claim 26; Columns 143-148; 128pp; English.

The osteogenic protein when in association with a matrix can induce at the locus of an implant the full development cascade of endochondral bone formation including vascularisation, mineralisation and bone marrow differentiation. The osteogenic protein can also be used to repair both bone and cartilage in the treatment of osteoarthritis. This sequence encodes the pre-proform of the protein.

* NOTE: This record contains 87 individual

* NOTE: This record contains 87 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low pass sequence sampling is useful for

* thentifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

On Aug 26, 1999 this sequence version replaced gi:5763790.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                           HSRYR7CC1 119118 bp DNA PRI 12-DEC-1999
Human DNA sequence from clone XX-PRYR7CC1 on chromosome 22 Contains an STS, GSSs, genomic marker D22S928, tc and ca repeat polymorphisms and a putative CpG island, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was identified as CDM:10211270 by the submitter.
